Documentation Classifications

In order to assist in the use of this product, GIGABYTE provides the following types of documentation:

- User Manual: detailed information & steps about the installation, configuration and use of this product (e.g. motherboard, server barebones), covering hardware and BIOS.
- User Guide: detailed information about the installation & use of an add-on hardware or software component (e.g. BMC firmware, rail-kit) compatible with this product.
- Quick Installation Guide: a short guide with visual diagrams that you can reference easily for installation purposes of this product (e.g. motherboard, server barebones).

Please see the support section of the online product page to check the current availability of these documents.

For More Information

For related product specifications, the latest firmware and software, and other information please visit our website at http://www.gigabyte.com

For GIGABYTE distributors and resellers, additional sales & marketing materials are available from our reseller portal: http://reseller.b2b.gigabyte.com

For further technical assistance, please contact your GIGABYTE representative or visit https://esupport.gigabyte.com/ to create a new support ticket

For any general sales or marketing enquiries, you may also message GIGABYTE server directly by email: server.grp@gigabyte.com

Chapter 1 GSM Server Overview

1-1 GSM (GIGABYTE Server Management) Software Package Overview

GSM (GIGABYTE Server Management) is GIGABYTE's proprietary multiple server remote management software platform. GSM is compatible with either IPMI or Redfish (RESTful API) connection interfaces, and comprises the following

GSM Server, a software program with an easy to use browser-based GUI to enable global remote monitoring and management of multiple GIGABYTE servers via each server node's BMC.

GSM CLI (GBT Utility), a command-line interface program to enable global remote monitoring and management of multiple GIGABYTE servers via each server node's BMC.

GSM Agent, a software program installed locally on each GIGABYTE server node that retrieves additional node information (CPU/Mem/HDD/PCI/...) from the OS and passes it to the BMC. This information can then be utilized by GSM Server or GSM CLI.

GSM Mobile, a remote server management mobile APP, available for both Android and iOS.

GSM Plugin, a plugin available for VMware's vCenter, allowing the user to perform remote

monitoring and management of GIGABYTE server nodes without having to switch to a separate software platform.

A logical diagram of these different software sub-programs can be seen below:

Each sub-program is available to download for free from each GIGABYTE server product page*. *Depending on product compatibility, some programs may not be available. Please download GSM Mobile from the Google (Android) or iOS Store.

Chapter 2 GSM Server Installation

2-1 Using GSM Server

GSM (Gigabyte Server management) Server has a user-friendly Graphics User Interface (GUI) called the GSM Server GUI. It is designed to be easy to use. It has a low learning curve because it uses a standard Internet browser. You can expect to be up and running in less than five minutes. This chapter allows you to become familiar with the GSM Server GUI's various functions. Each function is described in detail.

2-2 Hardware Requirements

Before using GSM Server, please check your system for the following required configuration requirements:

- System Processor: 2 GHz and above
- System Memory: Minimum 4 GB RAM
- Free Disk Space: 10 GB at least
- Node servers : 255 maximum

2-3 Software Requirements

2-3-1 Prerequisites for remote management server

Supported Browsers:

- Google Chrome 39.0.2171.65 m or later
- Mozilla Firefox 33.1.1

Operating System:

- Windows 2008 / 2012 R2 / 2019
- Ubuntu 16.04 or later
- Redhat/CentOS 6.3 or later

2-4 Installing GSM Server (Windows)

2-4-1 Installation Procedure

- 1. Unzip the file and run **GSM_Setup.exe**.
- 2. Then, a series of installation wizards appear.
- 3. Click Next.

GSM	Installer - InstallShield Wizard
	Welcome to the InstallShield Wizard for GSM Installer The InstallShield Wizard will install GSM Installer on your computer. To continue, click Next.
	< Back Next > Cancel

4. Click **Install** to start the installation.

5. Installation completed, click **Finish**.

2-4-2 Getting Started

 Open a browser and type in your identified IP. The IP address can be found using your DHCP server. Local URL: https://localhost:8443/GSM

Remote URL: https://[Server IP]:8443/GSM

GIGABYTE ⁻	Login to GSM Prese reput sorrares and personnel.	
	Password	
	Login	

NOTE!

If you can't connect to the GSM Server, perhaps the firewall blocks the connection , please check the rule settings:

2. 2. If the GSM UI works appropriately after installing the latest version of GSM server, please clear the browser cache data and try again.

2-5 Installing GSM Server (Linux)

2-5-1 Install/Un-install Steps for Ubuntu, Debian (Login as root)

1. Before installation, please check the packages sudo and ufw are already installed. Otherwise, GSM Server installation will fail.

#apt-get install sudo ufw

2. 2.2 Use deb package to install GSM.

#dpkg -i gsm_x. x_all.deb

3. Make sure that the package 'fontconfig' has already been installed before starting GSM. Install the package: 'fontconfig'.

#apt-get install fontconfig

4. Finish and start up GSM web page.

Connect to GSM: https://{your IP address}:8443/GSM

5. Uninstall GSM

#dpkg –r gsm

- Installation will install and place Java sources for GSM to /opt. Do not modify and remove them. It's very important.
- 2. After finishing installation, installer would add firewall exception, such as 8080, 8443, 162, 69 and tftp to public zone. If you do not use public zone as default, please add firewall exception manually.

2-5-2 Install/Un-install Steps for CentOS 7, RHEL, Fedora (Login as root)

1. Before installation, please check that packages sudo and firewalld have already been installed, or GSM installation will be failed.

#yum install sudo firewalld

2. Use RPM package to install GSM.

rpm -ivh gsm-x.x-1.x86_64.rpm

3. Make sure that the package 'fontconfig' has already been installed before starting GSM.

Install the package: 'fontconfig'. #yum install fontconfig

4. Finish and start up GSM web page

Connect to GSM: https://{your IP address}:8443/GSM

5. Uninstall GSM Server

#rpm -e gsm-x.x-1.x86_64

- Installation will install and place Java sources for GSM to /opt. Do not modify and remove them. It's very important.
- 2. After finishing installation, installer would add firewall exception, such as 8080, 8443, 162, 69 and tftp to public zone. If you do not use public zone as default, please add firewall exception manually.

Chapter 3 Using GSM Server

3-1 Overview

GIGABYTE		
	Login to GSM Please input username and password.	Ì
	User	
	Password	
	Login	

- 1. Open a web browser and type in your identified IP. The IP address can be found using your DHCP server.
- 2. Enter the following factory default values:
 - Username: admin
 - Password: password

The default user name and password are in lower-case characters.

When you log in using the root user name and password, you have full administrative powers. It is advised that once you log in, you change the root password.

3-1-1 GSM Server Setup Wizard

When you log into your GSM Server management console for the first time, you will be required to configure the basic settings via the setup wizard.

Setup Procedures:

1. Select your preferred language and click Next.

2. Configure the SNMP setting and click Next.

GSM Server Setup Wizard

3-3-6 Alert Management

SNMP Trap Setting

In the Trap Settings, user can set the IPv4 and IPv6 Destination List.

IPv6 and IPv4 are two completely separate protocols. IPv6 is not backwards compatible with IPv4, and IPv4 hosts and routers will not be able to deal directly with IPv6 traffic.

IPv6 has a significantly larger address space than IPv4. This results from the use of a 128-bit address, whereas IPv4 uses only 32 bits.

When you finish the configuration, click **Submit** to save configuration.

Destination	Enable	Ipv4/Ipv6	Address
	ON	۰	10.1.27.222
	CPF	® O	0.0.0.0
	077		0.0.0.0

NOTE! To make sure the Update function works properly, please ensure the GSM Server and the BMC network connections are in the same domain before processing the Update function.

3-3-8 Power Consumption

This screen displays information on the system power consumption. The information includes Current Power Consumption, Power Consumption Configuration and Power Consumption Monitoring.

To configure power limit, set Power Limit Management Activated to **ON** and input the value in the respective column. Click **Submit** to save the configuration.

3-3-9 SOL Terminal

This screen displays SOL Terminal information of the system.

To connect SOL terminal, follow the instructions below:

- 1. Select Character set from the drop-down list.
- 2. Select the file on your local system using Reconnect.

3-3-10 Software

This pages provides user to view the related software information. Software information includes GSM Agent Status, System Information, Network Information, PCI Information, and RAID Card Information. Please install GSM Agent separately on each server / node for which you wish to monitor this related information. Please see "GSM Agent User Manual" for more information. System Info, Network Info, PCI Info, RAID Information and SMART Information. Please install GSM Agent separately on each server / node for which you wish to monitor this related information. 3-4-1 Information

To add a new BMC node to a group, follow the steps as below:

- 1. Click Add IP and select the BMC node you want to add in a group.
- 2. When you have finished configuration, click Submit.

To delete an existing BMC node, follow the steps as below:

1. Click Delete IP and select the BMC node you want to delete from a group.

To rename the group, follow the steps as below:

- 1. Click Group Rename and enter the new name for the group.
- 2. Click **Submit** to apply changes.

3-8-1 IP Range

User can specify the IP range that is scanned during a normal discovery run. Follow the steps outlined below to configure IP discover.

- 1. Select Connection Interface to search BMC Server.
- 2. Click Create row to specify the IP range in the respective columns.
- 3. Enter Start IP and End IP in the respective columns.
- 4. Select Scan Type and define the Policy Name.
- 5. When you finish the configuration, click **Submit** to save your configuration.

• IP Range							
IP Range Setti	ng						
Delete	Start IP	End IP	Scan Type	Policy Name	Username	Password	Rescan
	10.1.111.10	10.1.111.200	BMC CMC	New policy	admin	password	Rescan

Scan Type	Description
BMC	Baseboard management controller, which gives a user or administrator the ability to control a remote system and the ability to perform a variety of functions. With BMC, data is only transmitted within the local area network.
CMC	Chassis Management Controller, which provides functionality for managing multiple server nodes within a single chassis, or multiple chassis. CMC is a higher level of control and monitoring of one or multiple chassis.
ESX	VMware ESX Server Controller.

3-8-2 Event Log

Event Log displays event log information for all nodes/systems within the defined IP range.

3-8-3 Alert Management

Alert Management enables the following configuration: GSM SNMP Setting and IPv4 Destination configuration, SMTP Server configuration, and Send Mail configuration for all nodes/ systems within the defined IP range.

GSM SNMP

GSM SNMP trap configuration includes SNMP setting and SNMP destination configuration.

Alert Management			
GSM SNMP			
Setting			
Alerting Enable		017	
Host Address		10.1.27.222 ¥	
Alerting Level		Unknown ¥	
- Critical: Only Critical event - Non-Critical Critical event - Non-Critical Critical event - Unknown: All event Destination IPvd Destination	Enable	IP4 Address	
1	077	0.0.0.0	
2	OFF	0.0.0.0	
3	orr	0.0.0.0	
4	OFF	0.0.0.0	

Parameter	Description/Resulting Action
Alerting Enable	Determine whether the trap is sent by connected node.
Host address	Displays the host address information.
Alerting Level	Determine the alerting level from the drop-down list. Please refer to Section 3-3-5 Event Log for description of alerting level.

Destination

GSM SNMP Destination configuration for all nodes/systems within the defined IP range.

Destination			
IPv4 Destination	Enable	IPv4 Address	
1	OFF	0.0.0.0	
2	OFF	0.0.0.0	
3	Off	0.0.0.0	
4	OFF	0.0.0.0	

Parameter	Description/Resulting Action	
Destination		
IPv4 Destination	User can configure 4 IPv4 Destination.	
Enable	Select ON to configure IPv4 address	
IPv4 Address	Enter specified IP address. When you finish the configuration, click Submit to save your configuration.	

3-8-4 Database

Database shows DB location information, provides a backup function, and enables firmware update for all nodes/systems within the defined IP range.

▼ Database				
Database usage				
	61.95%	c 37.46%		
	Total Size: 29.4 GB			
	Other Usage: 18.22 GB			
	Database Usage: 0.17 GB			
	Free Space: 11.01 GB			
Database Restore/Backup			€ Brows ▲Badup	
Database Reset				
Reset the database dat	ta			

3-8-5 Properties

Properties enables GSM TFTP server configuration for all nodes/systems within the defined IP range. Follow steps outlined below to configure TFTP server.

- 1. Define **Database** useage.
- 2. Define checking time. In each routine check, GSM will check log date
- 3. When you finish the configuration, click **Submit**.

Database
In each routine check, GSM will check database usage and data date
If disk usage over the settings, GSM will delete data from database
0% 10% 50% 50 %
Keep database data in $[\underline{365 v}]$ day(s)
tog
In each routine check, GSM will check log date
Keep log file in T v day(s)
Log rotation
Keep log files down to a manageable size
Rotate the log files each hour 💙
Rotation size 1 0 1024 50
BMC Node Update Setting
GSM will follow setting to update BMC node during fixed period.
Node quantity 50 300 50 nodes
Node update period 3 10 5 minutes
Sidmit

BMC Node Update Setting

Configuration of interval and number of nodes.

Parameter	Description
Node quantity	Search number of nodes.
Node update period	Update node intervals.

3-8-6 Gbt Interactive Utility

User can use Gbt Interactive Utility to set the path of Gbt Utility.jar. Then, execute related command.

3-8-7 Update

User can update GSM firmware and reset the system to default settings for all nodes/ systems within the defined IP range from this page.

To update, select the file on your local system using Browse.

- 1. Click **Update** to update to the new version of firmware.
- 2. To update Keystore, click Choose File and enter keystore password, then click Update.
- 3. To reset system to the factory default, click **Reset**.

v Update
